

AWS CRASH COURSE

1. What is AWS?

AWS (Amazon Web Services) is the world's largest cloud computing platform. It provides more than 200 cloud services that help individuals and companies build, deploy, and manage applications without owning physical servers.

AWS = Amazon Web Services.

AWS provides many services (compute, database, storage, DevOps, AI, etc.).

Companies use AWS to deploy applications.

AWS has data centers around the world.

Users access AWS resources through the internet.

2. Why was AWS created?

Before AWS:

- **Companies had to purchase servers.**
- **Build data centers.**
- **Hire maintenance teams.**
- **Upgrade hardware whenever traffic increased.**

This process was expensive and time-consuming.

AWS solved this problem by allowing users to rent computing resources over the internet.

3. What is cloud computing

Cloud computing is the delivery of computing resources such as servers, storage, databases, and networking over the internet instead of buying and maintaining your own physical infrastructure.

Cloud computing means you **don't own the physical server**.
